

TEST DMP ANTH410R

Data Collection

What data will you collect or create?

- Text, images, written accounts, timelines.
 - .txt, .png, .jpeg
- 4gb of data
- So long as things are backed up and metadata is included, these formats are OK for long-term access.
- I need to check about existing data, as that's something this would benefit from greatly, considering how easy it is for Internet information to disappear overnight.

How will the data be collected or created?

- Quality of reporting and papers will be held up to typical accuracy standards and will be double-checked against other trustworthy reports.
- Folder structure and nomenclature will be created first by point in the timeline of the data, and then by file type (i.e. .txt file, image files, etc.)
- Versioning will be handled through GitHub as different .ZIP files.
- Quality assurance processes will be adopted in the forms of crosschecking data, and comparing/sourcing from other academic or news sources to back up claims or experiences found on social media if/when possible.

Documentation and Metadata

What documentation and metadata will accompany the data?

- Images need to be able to be understood/read whether by using image files (e.g. .png, .jpeg, etc.) that can be read on most/all platforms, or through well written metadata for image reconstruction.
- Text files need to be able to be read for future interpretation.
- I will capture/create this documentation & metadata through keeping through documentation on the data, and writing alternative text when needed.
- TEI metadata standards should be followed to provide vital information on image and transcription relationships

Ethics and Legal Compliance

How will you manage any ethical issues?

- Is consent something that needs to be asked for when it comes to social media posts and the likes on the open Internet? How would one go about getting consent from users who no longer log-in?
- Identities would be protected by anonymization.

- I don't believe there would be any sensitive data in this data that wouldn't be protected by anonymization in this context.

How will you manage copyright and Intellectual Property Rights (IP/IPR) issues?

- Data that can be handled by citation will be handled as such.
- I'm unsure about the rest of the concepts of copyright and data licensing and such...

Storage and Backup

How will the data be stored and backed up during the research?

- USB backup
- GitHub backup
- PC backup
- Laptop backup
- This would make the responsible party for data backup, storage, & recovery would be on myself and GitHub's servers.

How will you manage access and security?

- Risks of data security would be corruption of one of the personal devices I'm using for storage & data corruption or leak from GitHub servers.
- Could be handled by making the GitHub copy private? Files saved under a password on a personal device?

Selection and Preservation

Which data are of long-term value and should be retained, shared, and/or preserved?

- Data of long-term value:
 - Timeline
 - Image transcriptions
 - Image relationships
- Foreseeable research uses:
 - Sociopolitical and cultural information from a certain time period or around certain subjects.

What is the long-term preservation plan for the dataset?

- It would be best for data like this to be preserved in more than one server across geography for protection from political unrest or natural disasters.
 - However, servers cost money to maintain & it wouldn't be an easy budget to set up multiple servers of one's own. Instead, look into archival repositories that may be interested in holding the data?

Data Sharing

How will you share the data?

- Data could be shared through archived access of the GitHub repository? This would be presented through a paper?
- Public & academic perspectives to share with, how would data be presented depending on the perspective?

Are any restrictions on data sharing required?

- Avoiding publishers that require a purchase to allow viewers to access the data, allowing the public to have a chance to read the research as well.

Responsibilities and Resources

Who will be responsible for data management?

- I would.

What resources will you require to deliver your plan?

- A place to store data to be shared via link?
 - GitHub?
 - Other servers/hosts?
-
